

Lab 4: VibeCoding - Chat History

PES1UG24CS237 · Repo: SETAPESU26/49_brick-breaker · Tool: Claude Code (Claude Opus 5.5) · 2026-10-07

Conversation

Prompt: lab 4 vibe coding finish it off in downloads the assignment

Claude: Read Lab_4_VibeCoding_Student_handout.pdf: fix the broken code of an assigned SETAPESU26 game repo, add the README features one by one with separate commits, record before/after videos, and upload code + videos + chat history to the Lab-4 folder of the personal lab repo. Asked for the assigned repo and the personal lab repo URL.

Prompt: <https://github.com/Krishna17092006/SE-PES1UG24CS237>

Claude: Cloned the personal lab repo. Listed the SETAPESU26 game repos and asked which one was assigned.

Prompt: 49 one

Claude: Cloned SETAPESU26/49_brick-breaker and read its README. Tasks: (1) refine collision detection, (2) game-over / win screen, (3) replay with difficulty choice, (4) sound effects. Installed pygame, copied the original code into Lab-4/ as a baseline commit and launched the original game for the 'before' video.

Claude: Task 1 - Collision detection. Bug: the paddle and every brick always did $vy *= -1$, so side hits never changed horizontal direction. Fix: added `_resolve_collision(rect)`, which compares the ball/rect overlap on each axis; the smaller overlap is the side that was hit. The ball is pushed out on that axis and its velocity is pointed away from the rect. Paddle top hits also steer the ball by hit position (edges give a sharper angle). Walls now clamp the ball and use `abs()` so it cannot stick in a wall. Verified headlessly: left/right brick hits flip `vx`, bottom hits flip `vy`.

Claude: Task 2 - Game over screen. Replaced the console print with a dimmed overlay showing YOU WIN! / GAME OVER and the final score, waiting for input (ENTER to play again, ESC to quit). Moved setup into a `reset()` method so a new round can start cleanly.

Prompt: wait Webhook Ingestion & Retry Mechanism Hub this is the thing right

Claude: Clarified: the Webhook hub is the SE mini project (Lab 3 diagram); Lab 4 is the assigned brick-breaker game. Confirmed before continuing.

Prompt: yup correct do it

Claude: Task 3 - Replay with difficulty. The end screen now shows a menu: Easy (ball speed 3, paddle 140), Medium (4, 100), Hard (6, 70). UP/DOWN + ENTER or keys 1/2/3 start a new game; ESC/Q exits. The chosen speed is kept when the ball resets after a lost life.

Claude: Task 4 - Sound effects. Added `game/sounds.py` which synthesizes short square-wave tones at runtime (no audio files): brick break, paddle hit, wall hit, life lost, a rising win jingle and a falling game-over jingle. It silently disables itself if there is no audio device. Verified with an autoplay run that wins the game (40/40 bricks) and plays each sound.

Commits

Commit	Change
Baseline	Original brick-breaker code from SETAPESU26/49_brick-breaker
Task 1	Side-aware collision detection for paddle, bricks and walls
Task 2	Win/lose end screen with final score that waits for input
Task 3	Replay option with Easy/Medium/Hard difficulty or exit
Task 4	Sound effects for brick, paddle, wall, life lost, win and game over
