Screenshoot 4

10. Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the estimations reasonably reflected the actual effort required. The stories with higher complexity, such as webhook ingestion and dead-letter queue handling, were assigned 8 story points, while HMAC validation, logging, and replay were assigned 5 points. The sprint was completed successfully, indicating that the estimates were generally appropriate.

2. Was your backlog well-prioritized?

Yes, the backlog was well-prioritized based on the importance of each functional requirement. Webhook ingestion, signature validation, and logging were given High priority because they are essential to the core functionality and security of the system. Dead-letter queue handling and webhook replay were given Medium priority because they mainly support failure recovery and operational management.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned well with the plan. All five User Stories were moved into Sprint 1 and completed by progressing them from To Do to In Progress and finally to Done. The total planned workload was 31 story points, and all planned stories were completed within the simulated sprint.

4. What insights did the burndown chart give about your team's capacity?

The Burndown Chart showed that the team was able to complete the planned workload of 31 story points during the sprint. As the stories were completed, the remaining work decreased until it reached zero. This indicates that the planned workload was manageable for the team's simulated capacity. The chart also provides a useful way to identify whether the team is progressing according to the planned sprint schedule.
